

Eniac's Discount Strategy

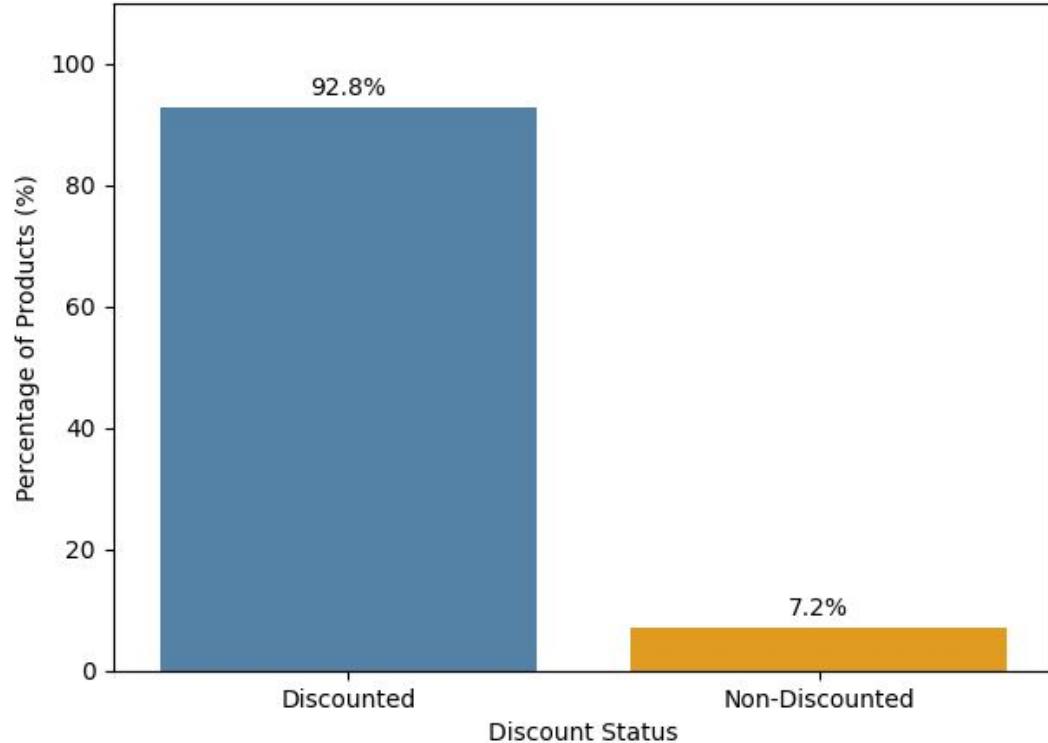

Our recommendation:

Eniac should continue discounting products, with more disciplined strategy than it runs today:

- Cap discount at a max discount of 20%.
- Rebalance discount toward high-end products, and away from budget items.
- Plan campaigns around the calendar.

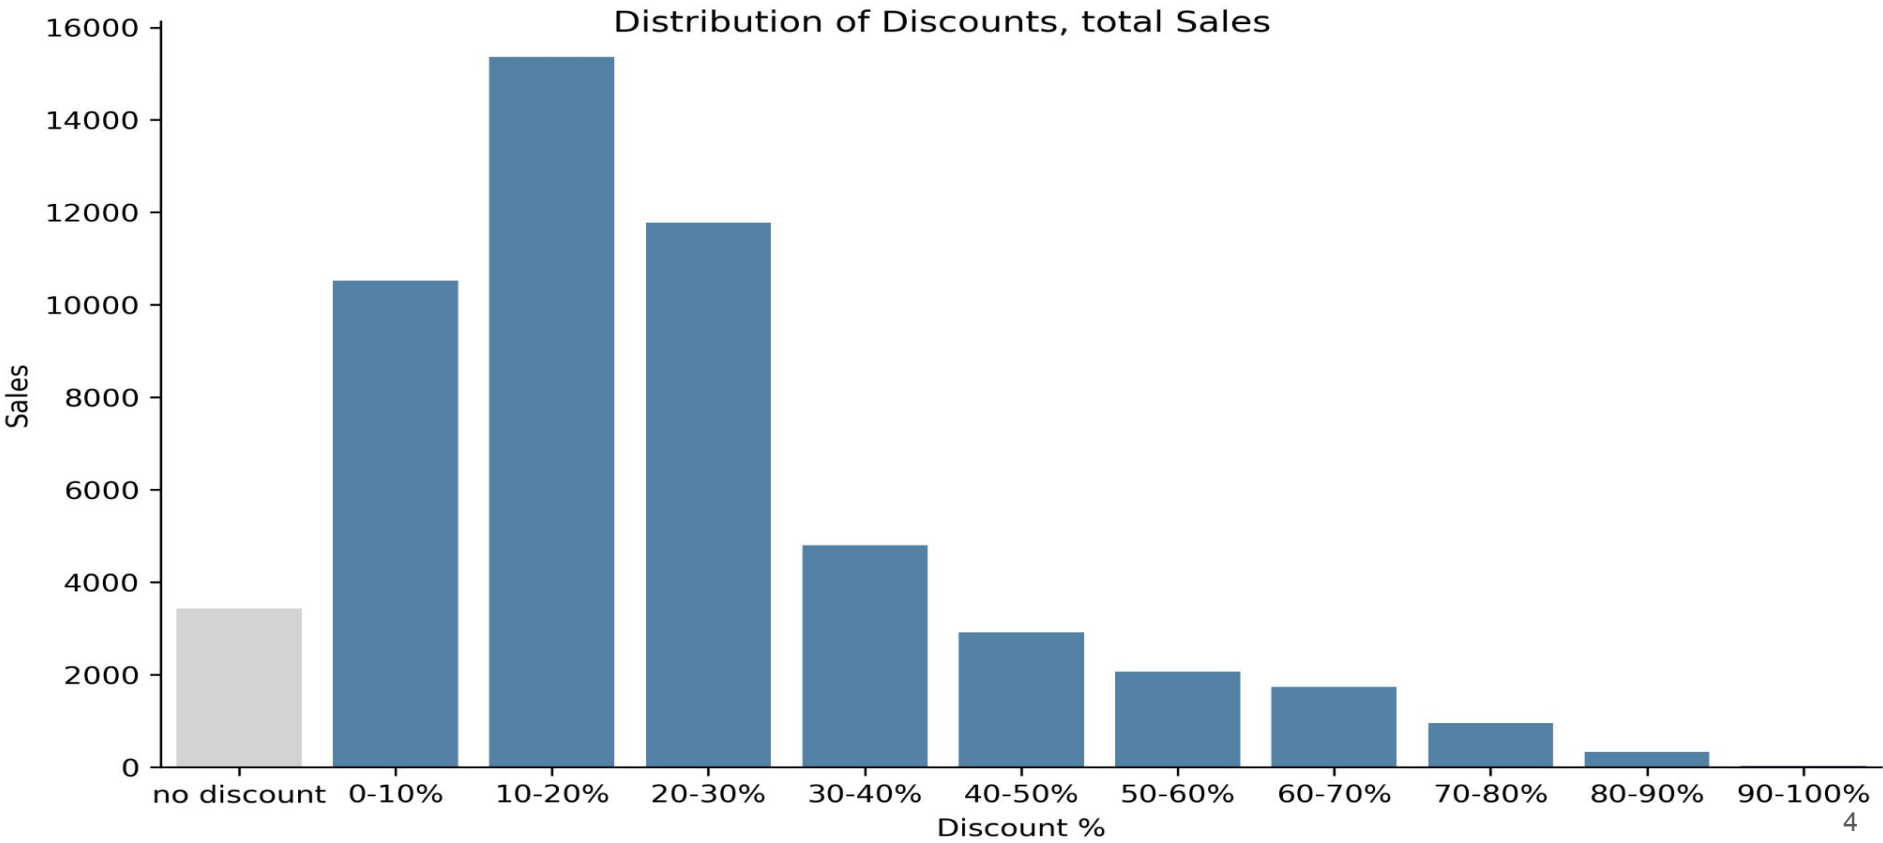

Discounted vs Non-Discounted Products

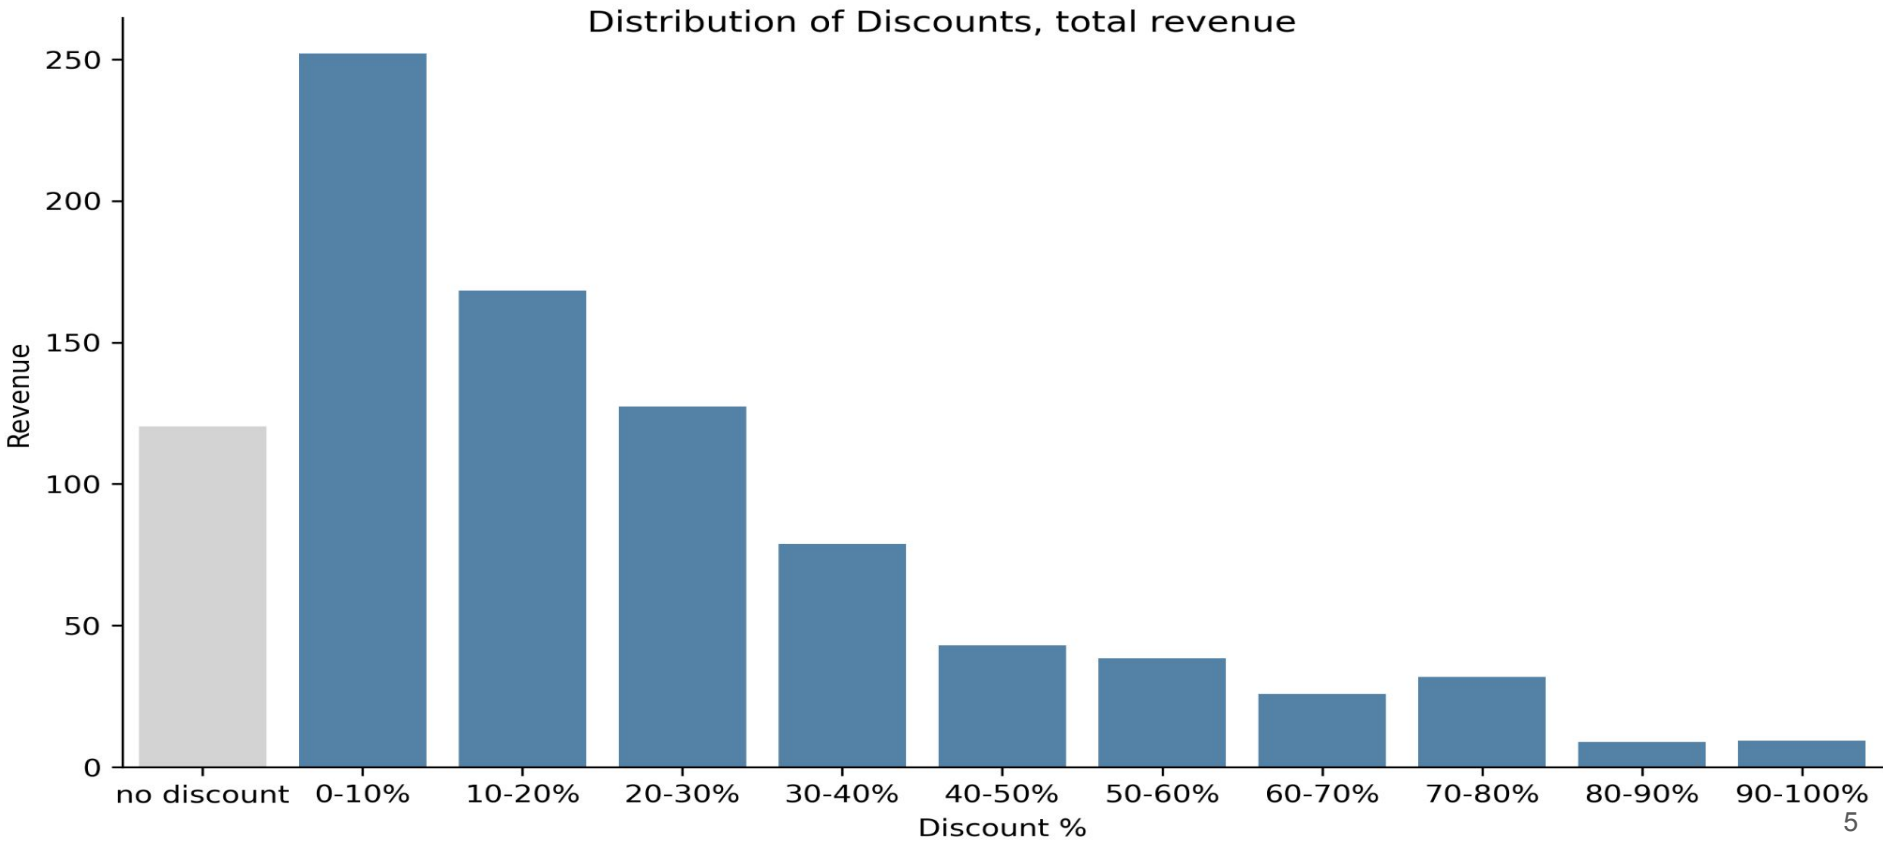

- 53,231 total sales records
- 49,404 discounted sales records
- 3,827 non-discounted sales records
- 4,906 unique products (SKUs)
- 92.8% of sales records are discounted
- 7.2% are non-discounted

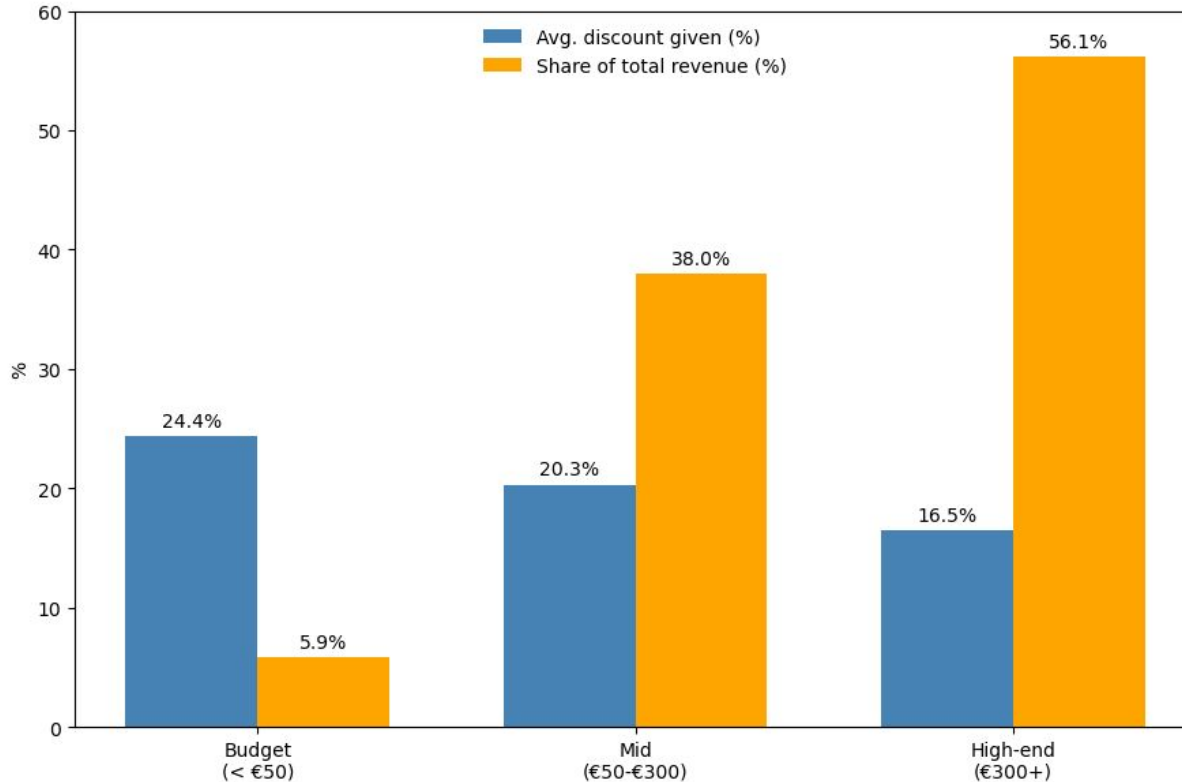

Distribution of Discounts - Sales

Distribution of Discounts - Revenue

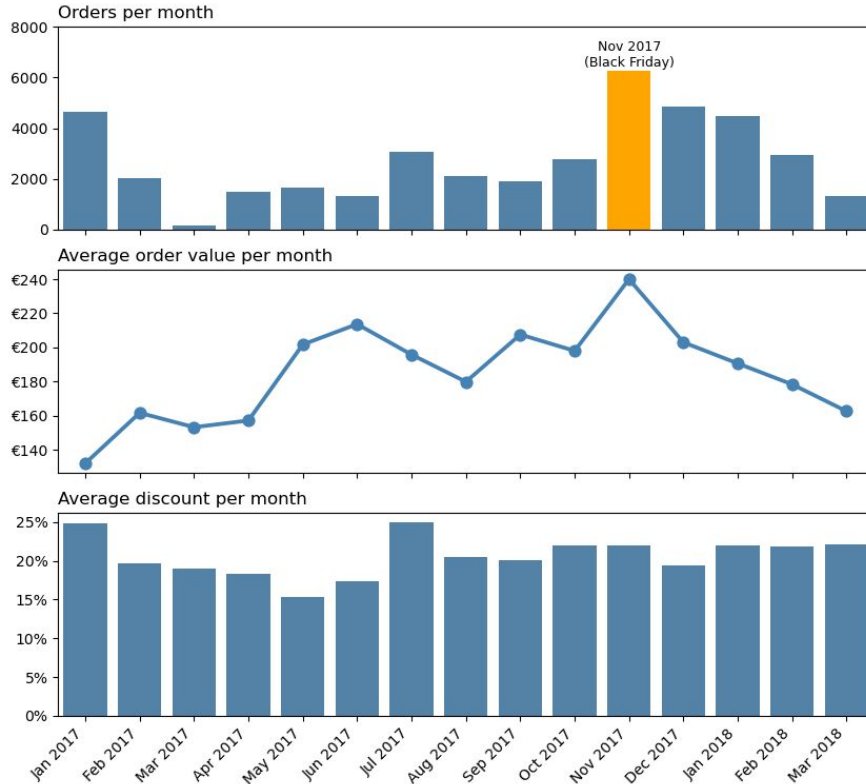

Discount is pointed at the wrong tier

- ❑ Budget items get highest discount, but bring in the least revenue.
- ❑ High-end items barely get discounted, yet bring in more than half revenue.

Seasonality & special dates

Nov, 2017

Best month of the year on both counts at once: 6266 orders and €240 average order value

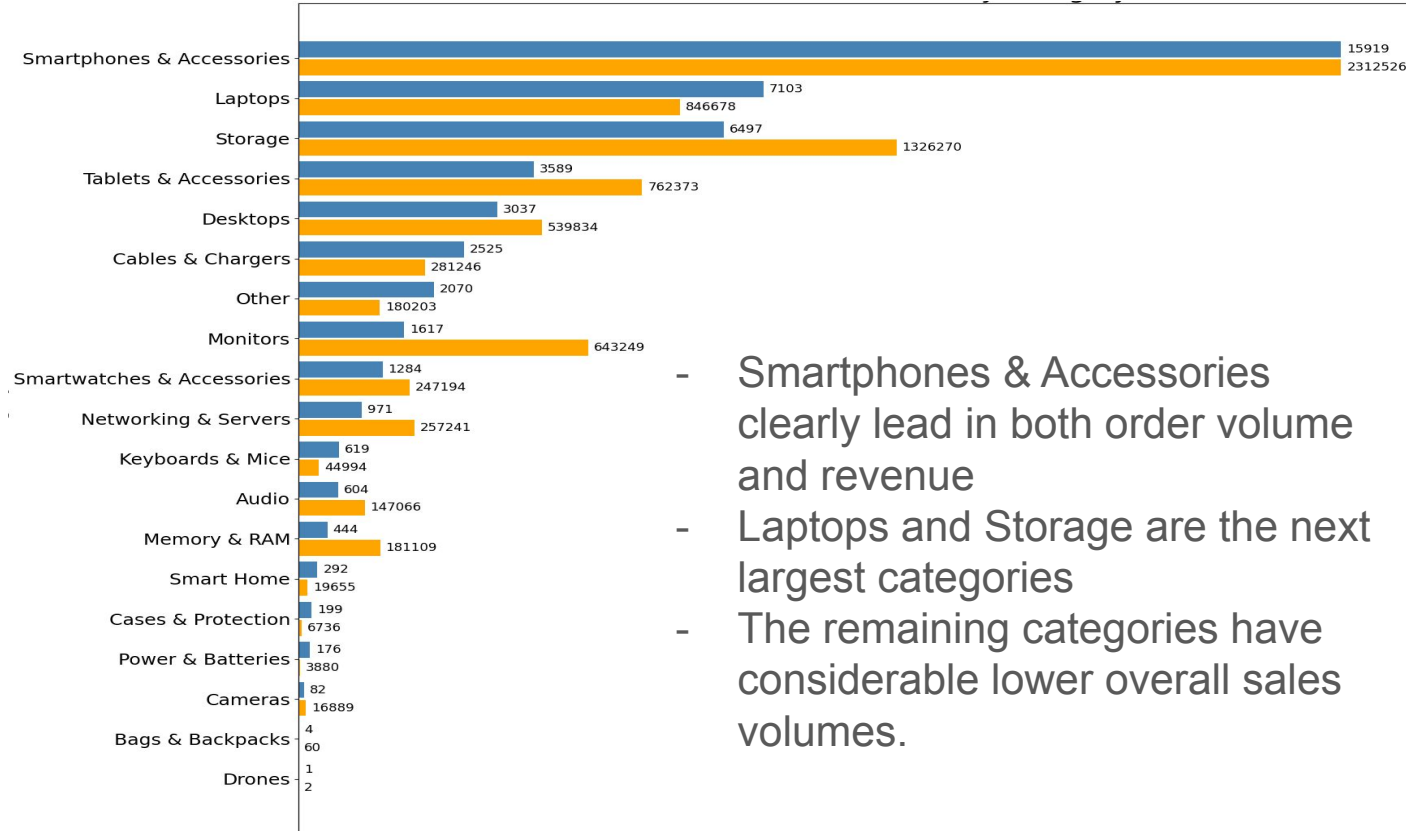

22 % discount

Not the year's highest - Jan and Jul ran ~25%, yet sold far less.

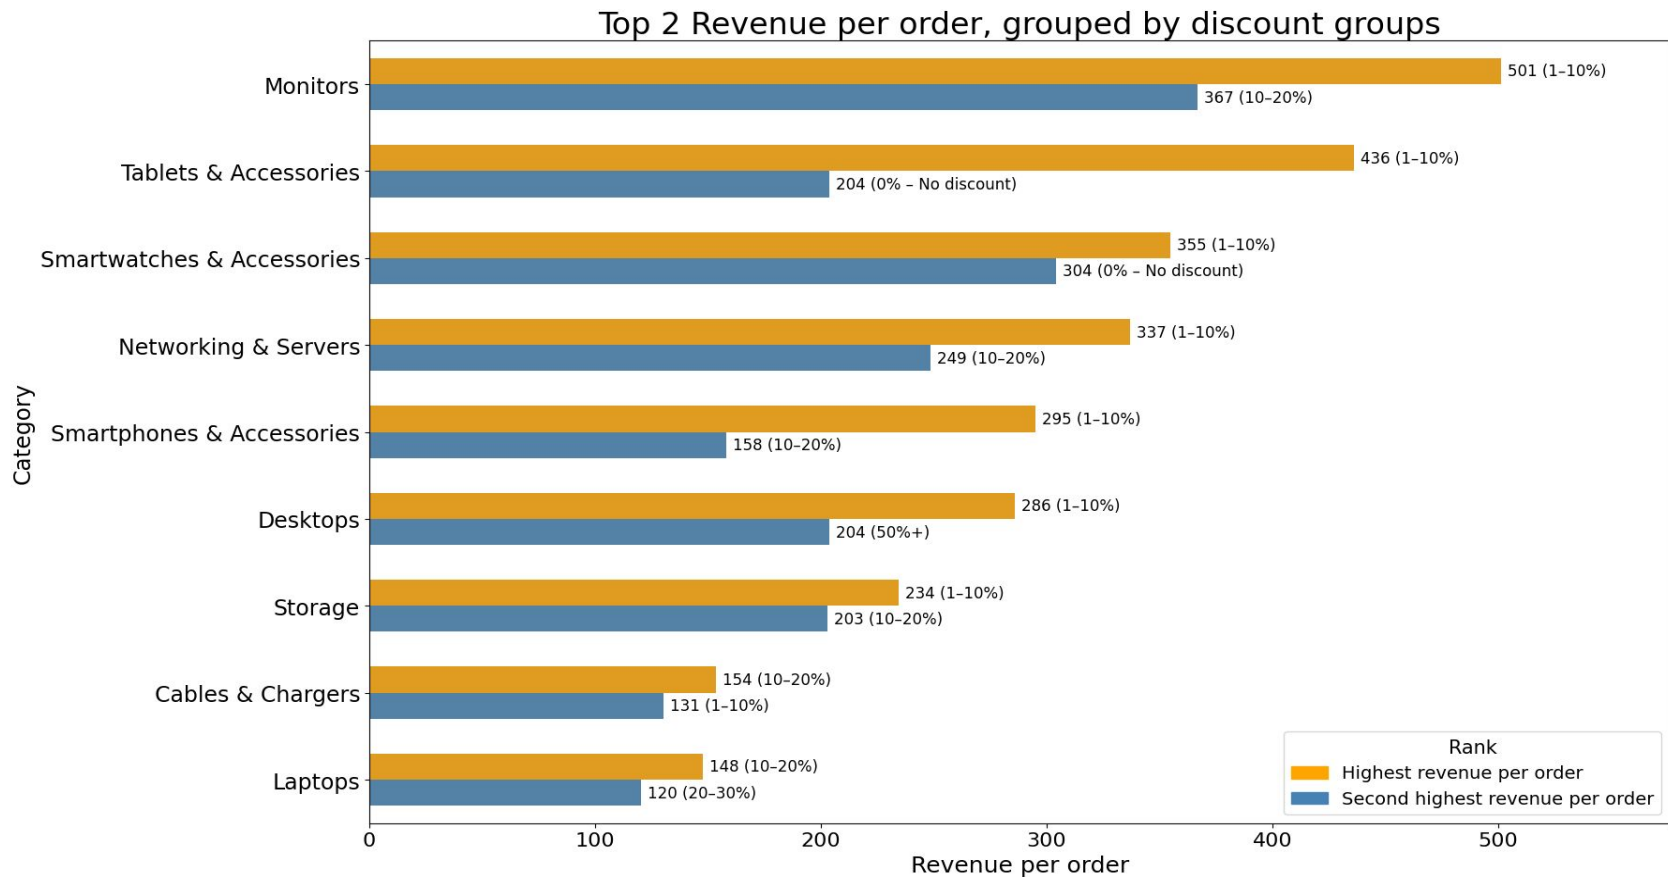

Takeaway

The calendar drives these swings, not only how high that month's discount ran.

Order Volume and Revenue by Category

Top 2 Revenue per order, grouped by discount groups

Improving Data Collection

Standardize number formatting

36,169 rows had malformed prices like “1.137.99” (double decimal points – promo price column) – all had to be dropped.

Validate price fields on entry

Multiple price columns across tables required deletion or column drops due to unusable formatting.

Store dates as true datetime

Dates arrived as text, not datetime — requiring manual conversion before use.

Align column names across systems

order_id vs id_order, state vs status — manual remapping was needed just to join tables.

Enforce uniqueness constraints

The products table contained 8,746 duplicate rows, removed before analysis could begin.

Audit fields regularly for corruption

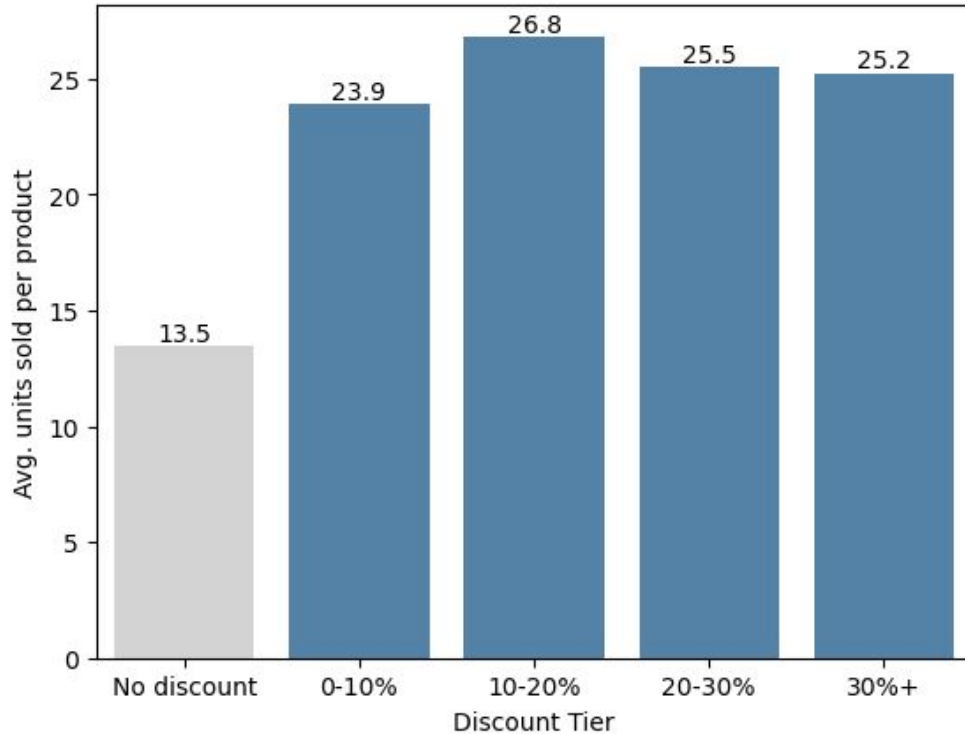

46 missing prices, 50 missing types, 7 missing descriptions — small individually, but easy to miss without routine checks.

Summary : cap depth, don't chase it

- Based on the overview of discounts and performance of different product categories, a discount cap at 20% is recommendable.
- Budget items already receive the highest discount yet generate the least revenue; high-end items are barely discounted despite producing half of the revenue.
- Demand varies by calendar like Black Friday and holidays so plan campaigns around the calendar.

Backup slides

Does a bigger discount sell more ?

- ❑ Any discount nearly doubles average units sold per product, vs. no discount at all.
- ❑ Going deeper barely changes anything
- ❑ No correlation b/w discount depth and units sold

Distribution of Discounts - Sales
